For the generative AI image, I ended up using Adobe Spark. I had heard in class that the images provided to Adobe Spark were voluntarily incorporated into the AI, which I believe is more ethical in comparison to other forms of generative AI. The images it generated were recognizable as baked potatoes, but if inspected closely, most people would be able to recognize that the images weren't real. Having worked a little with generative AI in the past, it makes sense that it wouldn't truly be able to generate a realistic version of a baked potato, and it was well within the parameters of what I expected. That being said, AI has certainly come a long ways and the images it can create become more indistinguishable from the real thing as more adjustments and updates are made.
